1 Tables in the editions **12**
- 1.1 Key . . . 12
- 1.2 Design of the comparisons . . . 13
- 1.3 Default and selected settings . . . 14
- 1.4 Parameter tables (chosen variant) . . . 25
- 1.5 Checks and detailed events (chosen variant) . . . 64
- 1.6 Temporal variation . . . 70
- 1.7 Settings selected on the first 30 trajectories . . . 72

2 Catalog tables: default and selected settings **78**

3 Catalog tables: parameters, all four variants **94**
- 3.1 Corridor . . . 94
- 3.2 Maze . . . 156

4 Catalog tables: checks and events, all four variants **218**

5 Sweep tables, compact (best variant) **236**
- 5.1 Corridor, $\alpha_0 = 0.10$ . . . 236
- 5.2 Corridor, $\alpha_0 = 0.15$ . . . 237
- 5.3 Corridor, $\alpha_0 = 0.20$ . . . 239

How to use this catalog

Every caption names the file, the data it was generated from and the exact line that restores the display in an edition of the paper (the arXiv version, the ablation report or the unpublished extended version). File paths are relative to the root of the paper's LaTeX source; its `tools/` and `catalog/` folders are published as `code/tools/` and `code/catalog/` of the code and data repository, while the other source folders (`sections/`, `appendices/`, `figures/`, `report/`) are not included there. Numbers with the prefix A (for example Table A.I or Appendix A.E-A) are those of the arXiv version of the paper, and numbers with the prefix R (for example Table R.8) are those of the ablation report. The settings S1–S5 are named T1–T5 in the data files and in some file names, New1–New5 in the other file names. Table fragments of the catalog are restored with `\ntable{../catalog/<style>/<name>}` (the macro `\ntable` of `appendices/n200_assets.tex` reads `appendices/generated_n200/<edition style>/`); figures of the catalog with `\nfigure{../catalog/<style>/<path>}`, inside the float and caption of the edition. Table values are generated by `tools/n200_tables/build_tables.py` (`--catalog` for the catalog fragments) and re-derived from the exports by `tools/n200_tables/check_tables.py`. The level at $K = \infty$ used by the check marks is

$$\delta_1 = \frac{\delta}{2b \ln^2 2}. \tag{1}$$

Abbreviations in the captions ([F], [A] and [T] are files of the N200 summary exports, which are not included in the repository):

- [F] `N200_numbers/final/common/metrics.json` (main grid, baselines, default)
- [A] `N200_numbers/new_anchors/common/metrics.json` (sweeps at S1–S5)
- [T] `N200_numbers/final/temporal/temporal_metrics.json`
- [V] `tools/n200_tables/tables_values.json.gz` (every printed cell of the editions, with its view id)
- [C] `appendices/generated_n200/catalog/CATALOG_TABLES.json` (catalog tables: view ids, restore lines)

The key below holds for every table.

Key to all tables. $\pm$: SD; $^{+}$: decision fraction; $\downarrow/\uparrow$: lower/higher is better; counts: trajectories of N_{MC} with a possible event, or the range from confirmed to possible events (Appendix A.E-A), except $\widehat{q}_{\mathrm{cert}}$ of S*, which gives confirmed events (Table R.8), 95% upper confidence bound (%) from possible events in parentheses; ✓: bound at most δ, or δ_1 for $K = \infty$; N-A: not applicable; bold: best mean of the four variants at one setting (ties all bold; never SDs, $\widehat{m}_{\mathrm{cert}}$, $\widehat{m}_{\tau^{\mathrm{use}}}$, $\widehat{m}_{p^{\max}}$); a/m: a trajectories with an excess above $\varepsilon_{\mathrm{chk}}$ among the m with a checked decision (a alone if $m = N_{\mathrm{MC}}$), bound over all N_{MC}.

Compact sweep. One row per setting $(\alpha_0, \alpha, \delta, K)$ of the main grid. Variant: the variant with the most best means in the four columns (best: the bold rule of the key; ties of a column all count); (k): the number k of the four columns in which it has the best mean; ties in k: smaller printed $\widehat{m}_c/c_{\max}$, then $\widehat{q}^{+}_{\text{unsafe}}$, $\widehat{q}^{+}_{\text{CBF}}$, $\widehat{T}_{\text{mis}}$, then the order V-U, V-Δ, V-L, V-C. ±: one sample SD over the trajectories that enter the mean; $^{+}$: decision fraction; ↓: lower is better.

Compact sweep. One row per setting $(\alpha_0, \alpha, \delta, K)$ of the main grid. Variant: the variant with the most best means in the four columns (best: the bold rule of the key; ties of a column all count); (k): the number k of the four columns in which it has the best mean; ties in k: smaller printed $\widehat{m}_c/c_{\max}$, then $\widehat{q}^{+}_{\text{unsafe}}$, $\widehat{q}^{+}_{\text{CBF}}$, $\widehat{T}_{\text{mis}}$, then the order V-U, V-Δ, V-L, V-C. ±: one sample SD over the trajectories that enter the mean; $^{+}$: decision fraction; ↓: lower is better.

Compact sweep. One row per setting $(\alpha_0, \alpha, \delta, K)$ of the main grid. Variant: the variant with the most best means in the four columns (best: the bold rule of the key; ties of a column all count); (k): the number k of the four columns in which it has the best mean; ties in k: smaller printed $\widehat{m}_c/c_{\max}$, then $\widehat{q}^{+}_{\text{unsafe}}$, $\widehat{q}^{+}_{\text{CBF}}$, $\widehat{T}_{\text{mis}}$, then the order V-U, V-Δ, V-L, V-C. $\pm$: one sample SD over the trajectories that enter the mean; $^{+}$: decision fraction; $\downarrow$: lower is better.

Table 57: Compact sweep (best variant), Corridor, $\alpha_0 = 0.30$. *File:* `appendices/generated_n200/catalog/report/compact_corridor_a030.tex`. *Data:* [F]; families `main_grid_200`, `matched_baselines_200`; 130 views (ids in [C]). *Restore:* `\ntable{../catalog/report/compact_corridor_a030}`; not used in the current editions.

Compact sweep. One row per setting $(\alpha_0, \alpha, \delta, K)$ of the main grid. Variant: the variant with the most best means in the four columns (best: the bold rule of the key; ties of a column all count); (k): the number k of the four columns in which it has the best mean; ties in k: smaller printed $\widehat{m}_c/c_{\max}$, then $\widehat{q}^{+}_{\text{unsafe}}$, $\widehat{q}^{+}_{\text{CBF}}$, $\widehat{T}_{\text{mis}}$, then the order V-U, V-Δ, V-L, V-C. ±: one sample SD over the trajectories that enter the mean; $^{+}$: decision fraction; ↓: lower is better.

Compact sweep. One row per setting $(\alpha_0, \alpha, \delta, K)$ of the main grid. Variant: the variant with the most best means in the four columns (best: the bold rule of the key; ties of a column all count); (k): the number k of the four columns in which it has the best mean; ties in k: smaller printed $\widehat{m}_c/c_{\max}$, then $\widehat{q}^{+}_{\text{unsafe}}$, $\widehat{q}^{+}_{\text{CBF}}$, $\widehat{T}_{\text{mis}}$, then the order V-U, V-Δ, V-L, V-C. $\pm$: one sample SD over the trajectories that enter the mean; $^{+}$: decision fraction; $\downarrow$: lower is better.

Compact sweep. One row per setting $(\alpha_0, \alpha, \delta, K)$ of the main grid. Variant: the variant with the most best means in the four columns (best: the bold rule of the key; ties of a column all count); (k): the number k of the four columns in which it has the best mean; ties in k: smaller printed $\widehat{m}_c/c_{\max}$, then $\widehat{q}^{+}_{\text{unsafe}}$, $\widehat{q}^{+}_{\text{CBF}}$, $\widehat{T}_{\text{mis}}$, then the order V-U, V-Δ, V-L, V-C. ±: one sample SD over the trajectories that enter the mean; $^{+}$: decision fraction; ↓: lower is better.

Table 62: Compact sweep (best variant), Maze, $\alpha_0 = 0.30$. *File:* `appendices/generated_n200/catalog/report/compact_maze_a030.tex`. *Data:* [F]; families `main_grid_200`, `matched_baselines_200`; 130 views (ids in [C]). *Restore:* `\ntable{../catalog/report/compact_maze_a030}`; not used in the current editions.

Compact sweep. One row per setting $(\alpha_0, \alpha, \delta, K)$ of the main grid. Variant: the variant with the most best means in the four columns (best: the bold rule of the key; ties of a column all count); (k): the number k of the four columns in which it has the best mean; ties in k: smaller printed $\widehat{m}_c/c_{\max}$, then $\widehat{q}^{+}_{\text{unsafe}}$, $\widehat{q}^{+}_{\text{CBF}}$, $\widehat{T}_{\text{mis}}$, then the order V-U, V-Δ, V-L, V-C. ±: one sample SD over the trajectories that enter the mean; $^{+}$: decision fraction; ↓: lower is better.
